

ABSTRACT OF THE DISCLOSURE

A hand-held massager includes a housing having a gripping portion and a body-contacting portion, the housing being configured for emitting a massaging liquid and the body-contacting portion being configured for emitting heat to a target surface.

5 The massager also emits a vibration and the amount of vibration is variable, as is the amount of heat and the amount of emitted massaging liquid. A pump is disposed within the housing for dispensing the massaging liquid, and a removable reservoir is in fluid communication with the pump. The reservoir is pivotably mounted to the massager between an operational position in which the reservoir is inclined relative to the body-contacting portion, and a refill position in which the body-contacting portion is placed in a generally vertical position and the reservoir is in a generally parallel position relative to the body-contacting portion.
